

CTI Report v2.0: SA Hosting Sector Exposure Analysis

Analyst: Neo

Date: 14 June 2026

Scope: South African hosting providers - exposed services + known CVEs

Classification: TLP:AMBER - Educational Portfolio

1. Executive Summary

OSINT investigation of 3 South African hosting providers identified internet-facing assets with exploitable services.

Key Finding: Pattern of exposed MySQL servers with CVE-related risk across multiple providers indicates potential systemic misconfiguration rather than isolated incidents.

Critical Findings:

1. Provider-A Johannesburg: Exposed MySQL service
2. Provider-B Johannesburg: Exposed Apache HTTP with critical vulnerability + SSH exposure
3. Provider-C Cape Town: Exposed MySQL service

Business Impact:

Exposed services create increased attack surface. Database exposure and critical web vulnerabilities may increase risk of data compromise.

Recommendation:

Remove unnecessary internet exposure, patch affected services, and strengthen access controls.

2. Methodology

OSINT Workflow: Shodan → IPinfo → VirusTotal → MITRE ATT&CK

Tools Used:

Shodan, IPinfo, VirusTotal, MITRE ATT&CK Framework.

Data Collection:

All information obtained via passive OSINT research. No active scanning performed.

Legal Compliance:

Analysis prepared for educational CTI portfolio purposes.

Finding 1: Exposed MySQL Server with CVE-2026-34319 - Johannesburg, ZA

Provider: Provider-A [SA Hosting Provider]

IP Address: REDACTED

ASN: AS37611

Port/Service: 3306/MySQL - Internet facing

IPinfo:

Country: ZA - South Africa

City: Johannesburg

VirusTotal:

Detection: 0/91 vendors flagged malicious.

MITRE ATT&CK:

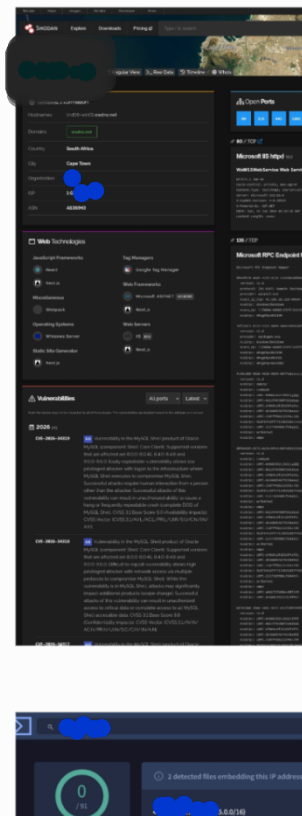

T1190 - Exploit Public-Facing Application

T1499 - Endpoint Denial of Service

Remediation:

Restrict port 3306, patch MySQL Shell, implement database firewall.

Finding 2: Critical Apache CVE + Exposed SSH - Johannesburg, ZA

Provider: Provider-B [SA Hosting/ISP Provider]

IP Address: REDACTED

ASN: AS37315

Services:

22/TCP OpenSSH
80/443 Apache HTTP

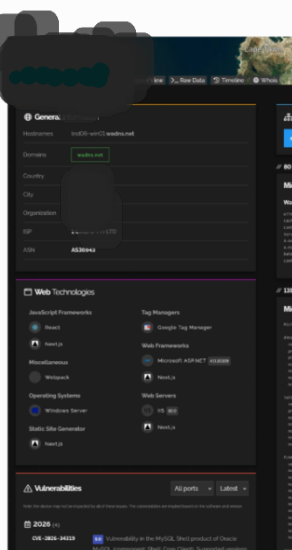

Shodan Vulnerability Data:
Critical Apache vulnerability exposure identified.

VirusTotal:
Detection: 0/91 vendors flagged malicious.

MITRE ATT&CK:
T1190 - Exploit Public-Facing Application
T1021.004 - SSH
T1499 - Endpoint DoS

Remediation:
Upgrade Apache, restrict SSH access, disable unnecessary modules.

Finding 3: Exposed MySQL Server with CVE-2026-34319 - Cape Town, ZA

Provider: Provider-C [SA Hosting Provider]

IP Address: REDACTED

ASN: AS36943

Port/Service: 3306/MySQL

IPinfo:

Country: ZA - South Africa

City: Cape Town

VirusTotal:

Detection: 0/91 vendors flagged malicious.

MITRE ATT&CK:

T1190 - Exploit Public-Facing Application

T1499.004 - Service DoS

Pattern Analysis:

Multiple exposed MySQL instances indicate a wider configuration risk.

Remediation:

Restrict database exposure and conduct wider sector review.

4. Recommendations

Immediate: Remove unnecessary exposed services, patch vulnerabilities, restrict administrative access.

Short Term: Deploy segmentation, monitoring, and vulnerability management.

Long Term: Maintain responsible disclosure and continuous threat intelligence processes.

5. Appendix

MITRE ATT&CK Techniques Referenced:

T1190 - Exploit Public-Facing Application

T1499.004 - Endpoint Denial of Service

T1021.004 - Remote Services - SSH

Provider identities and IP details are pseudonymised for responsible disclosure.

6. Legal, Ethics & Disclaimer

Data was collected from public OSINT sources for educational purposes only. Sensitive information has been redacted. No unauthorized access or active scanning was performed.
